

The two constants occupy different slots of the same operator

$$\psi_{NN} + [K^2 + c \rho_X(N)]\psi = 0$$

$$\rho_X = \chi_{\perp} \varrho_{\perp}^2 \operatorname{sech}^2 \theta, \quad \theta = \varrho_{\perp} (N - N_c)$$

$$\psi_{\theta\theta} + \left[\frac{K^2}{\varrho_{\perp}^2} + c \chi_{\perp} \operatorname{sech}^2 \theta \right] \psi = 0$$

$\varrho_{\perp}$

spectral / eigenvalue slot
kinematic conversion; width and resolution

$\chi_{\perp}$

potential-strength slot
gravitational stiffness; bound states and scattering
